YOUR BEST BUSINESS DECISION

Cyber Security for Non-IT Professionals

Computer security is all over the news. IT professionals are struggling with the growing sophistication, speed and number of attacks.

Can **you** help your business stay safe?

Non-IT professionals can support the fight. Until now, little thought has been given to the training needed to reduce the risk of cyber-attack. A recent YouGov survey showed that only 6% of employees have training about phishing scams. This unique workshop puts that lack of general awareness right. Think of the course as basic IT hygiene.

This one-day workshop is specifically designed for staff without specialist IT skills, managers and owner-managers. The course offers a unique insight into the world of cyber-security, but without any jargon.

Course Objectives:

- Safe computing as a concept
- Computer security as a holistic approach
- Balancing convenience and security
- Social engineering as a vector
- Business hygiene

Delegates will learn:

- How regular users can help protect themselves and their business
- An understanding of the scope and nature of the new threats
- How to practice 'safe' computing for regular users
- Five simple rules for avoiding viruses and malware
- The 100 most common passwords, and why not to use any of them!
- What is social engineering and how hackers use it
- Why cyber-security turns out to be the same as 'plain-old' security

Specific business-based case-studies are examined and explored. It is designed to be as interactive as possible with regular opportunities for discussion and collaborative learning.
